

MORNING DIGEST - May 05, 2026

What we cover today.

4 stories from the last 24 hours, including 3 research papers.

01. RESEARCH PAPER - SpecKV: Adaptive Speculative Decoding with Compression-Aware Gamma Selection

SpecKV: Adaptive Speculative Decoding with Compression-Aware Gamma Selection

QUICK TAKE:

- Speculative decoding accelerates large language model (LLM) inference by using a small draft model to propose candidate tokens that a larger target model verifies.
- A critical hyperparameter in this process is the speculation length γ , which determines how many tokens the draft model proposes per step.

WHAT YOU NEED TO KNOW:

- A critical hyperparameter in this process is the speculation length γ , which determines how many tokens the draft model proposes per step.

02. RESEARCH PAPER - AlbumFill: Album-Guided Reasoning and Retrieval for Personalized Image Completion

AlbumFill: Album-Guided Reasoning and Retrieval for Personalized Image Completion

QUICK TAKE:

- Existing methods either rely on generic inpainting models that often fail to maintain identity consistency, or assume that suitable reference images are explicitly provided.
- In practice, suitable references are often not explicitly provided, requiring the system to search for identity-consistent images within personal photo collections.

WHAT YOU NEED TO KNOW:

- Personalized image completion aims to restore occluded regions in personal photos while preserving identity and appearance.

03. RESEARCH PAPER - Enhancing RL Generalizability in Robotics through SHAP Analysis of Algorithms and Hyperparameters

Enhancing RL Generalizability in Robotics through SHAP Analysis of Algorithms and Hyperparameters

QUICK TAKE:

- Despite significant advances in Reinforcement Learning (RL), model performance remains highly sensitive to algorithm and hyperparameter configurations, while generalization gaps across environments complicate real-world deployment.
- Although prior work has studied RL generalization, the relative contribution of specific configurations to the generalization gap has not been quantitatively decomposed and systematically leveraged for configuration selection.

WHAT YOU NEED TO KNOW:

- Although prior work has studied RL generalization, the relative contribution of specific configurations to the generalization gap has not been quantitatively decomposed and systematically leveraged for configuration selection.

04. NEWS - Anthropic and OpenAI are both launching joint ventures for enterprise AI services - TechCrunch

Anthropic and OpenAI are both launching joint ventures for enterprise AI services - TechCrunch

QUICK TAKE:

- The Wall Street Journal, which first reported news of the partnership, reported the new venture was valued at \$1.5 billion, which includes a \$300 million commitment each from Anthropic, Blackstone, and Hellman & Friedman.
- Blackstone, Hellman & Friedman, and Goldman Sachs will be founding partners in the new venture, which is backed by a group of VCs, hedge funds, and private equity firms, including Apollo Global Management, General Atlantic, GIC, Leonard Green, and Sequoia Capital.

WHAT YOU NEED TO KNOW:

- Mere hours before the Anthropic announcement, Bloomberg reported that OpenAI was raising funds for a new venture called The Development Company, along very similar lines.
- The announcement comes just as Anthropic's chief rival is preparing to make a similar move.
